

Forklift Fork Positioner

Forklift Fork Positioner - The fork positioner is actually a hydraulic device which can allow the driver to operate the forklift without leaving the seat. They are made out of top quality materials and are meant to be able to endure the most demanding procedures and work surroundings. Side shifting units have the extra ability to laterally position the arms or the entire load in order to facilitate more exact lifting and position in a quicker and more efficient way.

The fork pocket is rather unique and enables the individual operating it to securely swing the blades into position without any worry of damaging the positioning cylinders. This allows the operator the choice to execute independent or simultaneous fork movement, dependent upon the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be converted into fork positioners on available units.
